

Logic Tools Overview

Logic Tools is a complete, state-of-the-art comprehensive solution supporting every facet of a horticultural business. It contains the functionality and features required of the grower, wholesaler, retailer, garden center, landscape design/build and maintenance segments.

From the ground up the system can assist the grower with production planning thru the dig cycle and shipping. This includes keeping and maintaining EPA logs and tracking production. In a multi-location environment the system provides for product transfers and tracking between locations. The system performs equally well at the wholesale or retail level, and is designed to support both business segments at the same time, along with the Landscape design/build and maintenance departments.

The majority of the system is designed to function at the desktop level, i.e. screen designs, keyboard and mouse usage, etc. are designed to function best on a theater style monitor with an attached keyboard and available mouse simply because those functions generally take place at the desk. Within the overall design specific functions have been designed to operate on a tablet and/or a desktop workstation. As an example inventory transactions are well suited to the tablet, as are yard sales entries.

The entire suite is totally integrated, but transparent to the user. When appropriate, financial transactions are generated and posted to the general ledger without user intervention. The traditional end-of-day processes have been removed, by design, yet all of the traditional end of day type reports are available by user request. Web based credit card processing is embedded in the system and available along with the appropriate audit trails.

The system, or suite, is fully integrated, not modularized, and is delivered as a complete business system. The user controls which business functions, or modules, are used in any environment. User security is provided in such a way as business functions not intended to be used, or not authorized to a specific person, simply do not appear on their desktop. Business functionality and/or user security can be turned on/off by a simple mouse click.

The complete suite is comprised of the follow business functions;

- Production Planning
- Accounts Receivable
- Accounts Payable
- General Ledger
- Inventory Control
- Sales & Estimating
- Job Costing
- Appointment Scheduling
- Yard Sales
- Label & Sign Printing
- Embedded CRM
